

# Discussion Topics and Ego Networks on Twitter

Emma S. Spiro

University of California, Irvine  
Department of Sociology

Presented at MURI AHM May 25, 2010

This material is based on research supported by the Office of Naval Research  
under award N00014-08-1-1015.

# Talk Outline

- ▶ Project Motivation
- ▶ Introduction to Twitter
- ▶ Data Collection
- ▶ Communication Dynamics
- ▶ Structural Characteristics of Personal Networks

# Project Motivation

- ▶ Informal communication channels are often the primary means by which time-sensitive hazard information first reaches members of the public.
- ▶ Social media technologies, e.g. micro-blogging, provide a means for gathering, sorting and disseminating information — a venue for collective problem solving.
- ▶ Relatively little is known about the dynamics of informal information communication in emergencies or hazards.

### Search tip

Use **until**: immediately before a specific date to find tweets sent before and until that date. Example: `ftw until:2009-07-16`

## Get short, timely messages from **Tori Gabor**.

Twitter is a rich source of instantly updated information. It's easy to stay updated on an incredibly wide variety of topics. **Join today** and **follow @gabortori**.

# Why Twitter?

- ▶ Twitter represents an extremely large social network — 100 million users.
- ▶ Tie formation and destruction are rapid and widespread.
- ▶ Combination of text and interpersonal networks.
- ▶ Extreme heterogeneity in terms of network properties as well as communication behavior.
- ▶ Scalable methods and models.

# Modeling Discussion Topics on Twitter

Consider the population of individuals talking about a given topic.  
Can we make predictions about

- ▶ the dynamics of this communication?
- ▶ the network properties of this discussion group?
- ▶ For now, sampling-based approaches.

# Project Activities

Using automated data collection methods we collect information

- ▶ on the dynamics of communication content.
- ▶ on the properties of communicants' online interpersonal networks.

# Twitter Data Collection, Part I - Topic Dynamics

- ▶ Public, global content is searchable by keyword.
- ▶ Begin with a list of topics each characterized by a set of keywords.
- ▶ We include a control topic in which words are chosen from Ogden's word list.
- ▶ Automated data collection designed to capture **all public tweets** containing the given keyword.
- ▶ Potential missing data.

# Twitter Data Collection, Part II - Personal Networks

- ▶ Each user on Twitter has a personal network consisting of friends (out-ties) and followers (in-ties).
- ▶ For each keyword we sample 20 **recently active** users each day and keep them in the sample for 7 days.
- ▶ For each user we obtain a list of alters, as well as various covariates if available.
- ▶ Potential covariates: location, privacy settings, timezone, account creation date, activity level, language.

# Research Questions

- ▶ What seasonality exists within a discussion?

# Research Questions

- ▶ What seasonality exists within a discussion?
- ▶ How do exogenous events affect communication dynamics?

# Research Questions

- ▶ What seasonality exists within a discussion?
- ▶ How do exogenous events affect communication dynamics?
- ▶ What are the structural characteristics of the interpersonal networks of the discussant group?

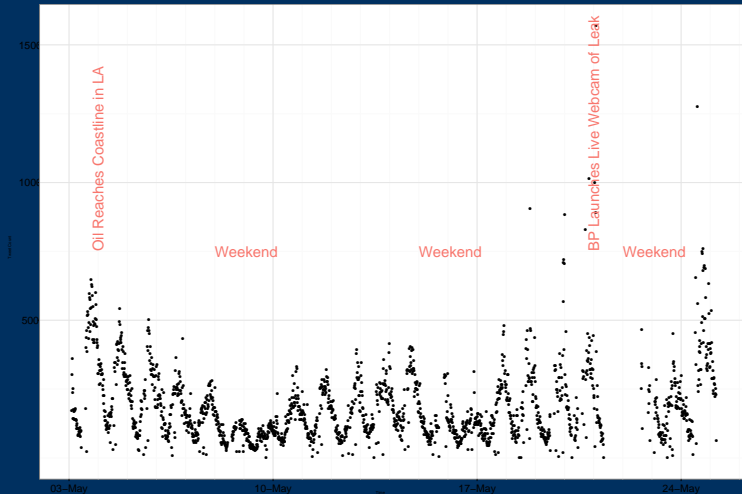

# Research Questions

- ▶ What seasonality exists within a discussion?
- ▶ How do exogenous events affect communication dynamics?
- ▶ What are the structural characteristics of the interpersonal networks of the discussant group?
- ▶ Individual level prediction?

# Oil spill: Seasonality and Exogenous Events

# Structural Characteristics of Personal Networks

- ▶ Mean degree of topic participants.
- ▶ Is an increase in overall mean degree due to those already present in the discussion gaining alters or is it due to high degree individuals entering the discussion?

# Degree Distribution Dynamics

- ▶ Consider the mean degree in the population, i.e. topic discussion sample, over time.

# Degree Distribution Dynamics

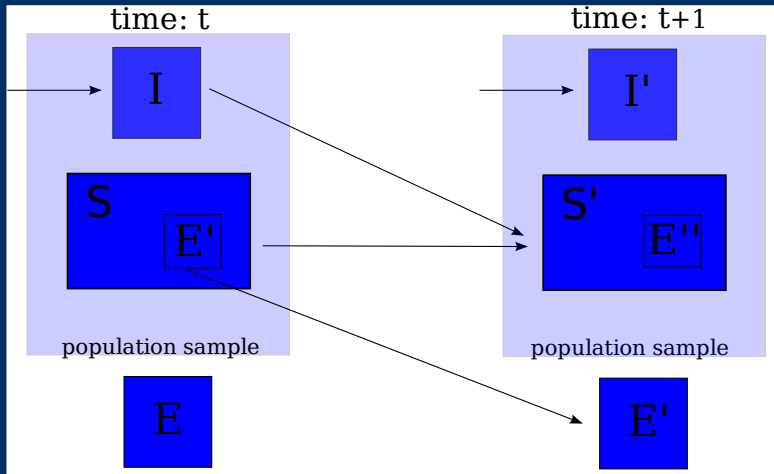

- ▶ Consider the mean degree in the population, i.e. topic discussion sample, over time.
- ▶ The mean degree is affected by different population processes: those entering the sample (**immigrants**), those who stay in the sample (**non-migrants**), and those who leave the sample (**emigrants**).

# Lightning: Mean Degree Dynamics

# Degree Dynamics Decomposition

# Degree Dynamics Decomposition

$$\begin{aligned}\bar{d}_{t+1} - \bar{d}_t &= \frac{\bar{d}_{t+1}(I')N^{I'} + \bar{d}_{t+1}(S')N^{S'}}{N_{t+1}} - \frac{\bar{d}_t(S')N^{S'} + \bar{d}_t(E')N^{E'}}{N_t} \\ &= \frac{\bar{d}_{t+1}(I')N^{I'}}{N_{t+1}} + \frac{\bar{d}_{t+1}(S')N^{S'}}{N_{t+1}} - \frac{\bar{d}_t(S')N^{S'}}{N_t} - \frac{\bar{d}_t(E')N^{E'}}{N_t}\end{aligned}$$

# Degree Dynamics Decomposition

- ▶ Let  $\bar{d}_{t+1}(I') = \alpha \bar{d}_t(S')$ ,  $\bar{d}_t(E') = \epsilon \bar{d}_t(S')$ ,  $\bar{d}_{t+1}(S') = \gamma \bar{d}_t(S')$ .
- ▶ Intuitively, we are expressing the respective degrees of the immigrants, emigrants, and (t+1) stayers in terms of what the stayers' degrees were at time t.
- ▶ Likewise, let  $w_{t+1}^{I'} = N^{I'} / N_{t+1}$ ,  $w_t^{E'} = N^{E'} / N_t$ , and  $w_{t+1}^{S'} = N^{S'} / N_{t+1}$  be the relative population weights for the three groups.

$$\bar{d}_{t+1} - \bar{d}_t = \alpha \bar{d}_t(S') w_{t+1}^{I'} + \gamma \bar{d}_t(S') w_{t+1}^{S'} \left[ 1 - \frac{N_{t+1}}{\gamma N_t} \right] - \epsilon \bar{d}_t(S') w_t^{E'}$$

# Lightning: Mean Degree Dynamics

# Summary

- ▶ Modeling large scale dynamic networks with text component.
- ▶ Scalability.
- ▶ Activity sampling and egocentric properties.

# Future Work

- ▶ Time-series analysis of the topic data.
- ▶ Complete sampling of discussant groups.
- ▶ Decomposition of the change in average number of shared partners or other statistics.
- ▶ Statistical models of topics on dynamics networks.
- ▶ Questions?
